Framework Timing Spec

SECTION A - Process Execution Summary

Process | Runtime (Sec) | Status | Quality Notes

Process = The major framework process that was executed and timed. Examples include Set Up System Sheets, Create / Refresh All Templates, Dashboard Quality Start Up, Dashboard Quality Validate Templates, Dashboard Quality Workflow, Rebuild Dashboard Defaults, Show Templates, Hide Templates, Show System Sheets, and Hide System Sheets.

Runtime (Sec) = Total elapsed execution time measured in seconds for the process. Calculated using framework timing start and stop timestamps.

Status = Runtime classification generated from timing thresholds. Examples include PASS, WARNING, SLOW, BOTTLENECK, CRITICAL, FAILED, or NOT RUN.

Quality Notes = Additional information about execution success, abnormal behavior, timing anomalies, or process-specific observations.

SECTION B - Timing Severity Analysis

Process | Runtime (Sec) | Severity | Quality Notes

Process = The process being analyzed for performance severity. Data comes from Section A runtime results.

Runtime (Sec) = Total runtime recorded for the process.

Severity = Performance classification based on governed timing thresholds. Examples include PASS, WARNING, SLOW, BOTTLENECK, and CRITICAL.

Quality Notes = Explanation of why the severity was assigned and any recommended follow-up actions.

SECTION C - Detailed Process Timing Log

Timestamp | Process | Runtime (Sec) | Status

Timestamp = Exact date and time the process completed or logged its timing event. Generated by the framework timing logger.

Process = The process or event being recorded. Examples include Show Templates, Hide Templates, Create Templates, Dashboard Quality Start Up, Validate Templates, or Rebuild Dashboard Defaults.

Runtime (Sec) = Elapsed time for the specific process execution.

Status = Execution result for the timing event. Examples include PASS, FAIL, WARNING, NOT RUN, or ERROR.

SECTION D - Performance Findings

Finding | Status | Impact | Quality Notes

Finding = The performance issue or observation identified during timing analysis. Examples include Slow Startup Runtime, Template Creation Bottleneck, Excessive Dashboard Scans, or Long Validation Runtime.

Status = Severity assigned to the finding. Examples include PASS, WARNING, SLOW, BOTTLENECK, or CRITICAL.

Impact = The operational effect of the finding. Examples include Increased Runtime, User Delay, Framework Bottleneck, or Template Build Delay.

Quality Notes = Detailed explanation of the finding, supporting evidence, and observed runtime values.

SECTION E - Optimization Recommendations

Process | Recommendation | Priority | Quality Notes

Process = The process requiring optimization. Data comes from timing analysis and performance findings.

Recommendation = Suggested improvement. Examples include Cache Dashboard Definitions, Reduce Sheet Reads, Consolidate Validation Passes, Eliminate Repeated Formatting, or Build Lookup Maps.

Priority = Recommended implementation priority. Examples include LOW, MEDIUM, HIGH, or CRITICAL.

Quality Notes = Explanation of the recommendation and expected performance improvement.

SECTION F - Timing Signoff

Validation Item | Status | Issue | Quality Notes

Validation Item = The timing governance requirement being evaluated. Examples include Total Runtime Review, Critical Findings Review, Bottleneck Review, Timing Coverage Verification, Logging Integrity Verification, and Timing Signoff.

Status = Result of the validation item review.

Issue = Specific timing issue preventing successful signoff. Examples include Critical Runtime Detected, Missing Timing Logs, Incomplete Coverage, or Excessive Runtime.

Quality Notes = Additional explanation supporting the signoff decision and identifying any required corrective action.

SECTION G - Timing Coverage Verification

Process Category | Expected Processes | Status | Quality Notes

Process Category = The major framework area being reviewed for timing coverage. Examples include System Sheets, Templates, Dashboard Quality, Dashboard Maintenance, and Visibility Controls.

Expected Processes = The required processes that should be logging timing data for the category.

Status = Indicates whether timing coverage is complete for the category.

Quality Notes = Missing timing entries, incomplete coverage, or validation findings.

Examples:

```None
System Sheets

Expected:

Set Up System Sheets

Create Dashboard Quality Report

Create Framework Timing Report
```

```None
Templates

Expected:

Show Templates

Hide Templates

Create / Refresh All Templates

Validate Templates
```

SECTION H - Runtime Trend Summary

Process | Current Runtime | Trend | Quality Notes

Process = The process being evaluated for runtime trends.

Current Runtime = Most recent measured runtime for the process.

Trend = Comparison against historical executions. Examples include Improved, Stable, Slower, Significantly Slower, or No Historical Data.

Quality Notes = Explanation of the trend and potential causes.

If historical timing retention is not implemented, this section should display:

```None
Trend Tracking Not Available
```

until runtime history is added.

SECTION I - Framework Timing Summary

Health Check | Status | Issue | Quality Notes

Health Check = Summary metric derived from the Framework Timing Report. Examples include Total Processes Timed, Average Runtime, Critical Findings Count, Bottleneck Count, Coverage Status, and Overall Timing Health.

Status = Overall timing status for the metric.

Issue = Timing issue affecting the metric. Examples include Missing Coverage, Critical Process Runtime, Excessive Average Runtime, or Incomplete Logging.

Quality Notes = Additional explanation of the timing summary metric and supporting calculations.

SECTION J - Framework Timing Signoff

Audit Item | Status | Issue | Quality Notes

Audit Item = Final timing readiness validation. Examples include Timing Report Complete, All Required Processes Logged, No Critical Timing Findings, Optimization Review Complete, and Timing Ready for Release.

Status = Result of the timing signoff validation.

Issue = Any condition preventing timing signoff.

Quality Notes = Final timing assessment and release readiness determination.

Framework Timing Data Sources

Runtime Data

Source:

```None
Framework Timing Logger

Start Timestamp

End Timestamp

Elapsed Time Calculations
```

Severity Classification

Source:

```None
Governed Timing Thresholds
```

Example:

```None
0-5 sec      PASS

5-15 sec     WARNING

15-30 sec    SLOW

30-60 sec    BOTTLENECK

60+ sec      CRITICAL
```

Process Inventory

Source:

```None
Menu-Accessible Framework Functions

Major Validation Processes

System Sheet Processes

Template Processes

Dashboard Processes
```

Required Timed Processes

```None

Set Up System Sheets

Show Templates
```

```
Hide Templates

Show System Sheets
Hide System Sheets

Create / Refresh All Templates

Dashboard Quality Start Up
Dashboard Quality Validate Templates
Dashboard Quality Workflow

Rebuild Format Dashboard Defaults
```

These are the processes the Framework Timing Report should monitor and evaluate, rather than timing individual helper functions or low-level utility functions.
