

Governance Areas Confirmed in v1.5.11

1. Governing Authority Hierarchy

1. Framework Specification
2. Current Approved Production Script
3. Dashboard Configuration
4. Template Definitions
5. Validation / Timing Reports

The script explicitly states:

- Dashboard/template engine owns formatting.
 - Business logic remains owned by the production processing layer.
 - Single-file architecture remains the approved architecture.
 - Retired functionality must not be reintroduced.
-

2. Architecture Governance

Approved:

- Single File Architecture
- Dashboard First Governance
- Template First Formatting
- Dashboard Controlled Templates
- Dashboard Controlled Validation
- Dashboard Controlled Timing
- Full Template Copy Output Creation
- Business Logic Separation from Formatting Engine

Prohibited:

- Runtime column add/remove behavior
 - Reintroduction of Sort Order Audit
 - Template-level row height governance
 - Manual formatting outside governed dashboard/template paths
-

3. Sheet Structure Governance

Protected standards:

Standard	Value
Header Row	4
Data Start Row	5
Template Driven	Yes
Dashboard Driven	Yes
Output Creation Method	Template Copy
Manual Formatting	Not Allowed

Defined in constants:

None

```
HEADER_ROW = 4  
DATA_START_ROW = 5
```

4. Template Governance

Approved output generation path:

None

```
Dashboard  
↓  
Verified Template  
↓
```

Copy Template

Paste Values

Trim Sheet

Apply Final Row Height Lock

The script explicitly identifies this as:

"approved Template First path" and states that manual formatting is not performed during output creation.

5. Row Height Governance

Current governance:

Final row-height locking is only permitted on:

- Raw Data
- Demo P
- Master List
- Disenrolled Exclusion List

Not permitted:

- Template creation
- Template validation
- Template refresh

The script specifically states:

Keep row-height locking out of template builds; apply only as a final output step on governed sheets.

6. Dashboard Governance

Dashboard owns:

- Sheet definitions
- Template definitions
- Header definitions
- Column definitions
- Column widths
- Visibility rules
- Formatting rules
- Validation rules
- Timing configuration

Processing code must consume dashboard definitions rather than creating independent rules.

7. Validation Governance

Dashboard Quality is the validation authority.

Validation domains include:

- Template validation
- Date format validation
- Header validation
- Width validation
- Sheet definition validation
- Workflow verification

Framework Test 6 validates date formatting.

Framework Test 7 validates intentional template failure detection.

8. Date Format Integrity Governance

Protected date columns are centrally governed.

Examples:

- Date of Birth
- Enrollment Date
- Disenrollment Date

- Care Plan Start Date
- Last Care Plan
- Next Care Plan Due
- Master List Update Month

Validation checks multiple rows and multiple templates against expected formats.

9. Disenrollment Governance

Confirmed rules:

- Disenrollment operates at PMR level.
 - If a PMR is disenrolled, all associated rows are removed.
 - Disenrolled PMRs move to Disenrolled Exclusion List.
 - Disenrolled output writes one primary row per PMR.
 - Demo P processing removes disenrolled PMRs after transfer.
-

10. Demo P Governance

Demo P is the processing authority for:

- Banner synchronization
- Contact processing
- Phone processing
- Address processing
- Primary row assignment
- Disenrollment removal

Demo P templates must be generated through the dashboard pipeline only.

11. Master List Governance

Master List updates occur through controlled update actions:

- Enrollment actions
- Disenrollment actions
- Primary row updates
- Contact row merges

Metadata tracking includes:

- Update Status
- Update Month
- Source Sheet

Every update records source lineage.

12. Timing Governance

Framework Timing Report is the timing authority.

Severity hierarchy:

None

INFO

WARNING

SLOW

BOTTLENECK

CRITICAL

Timing records are retained and written through the governed timing framework.

13. System Sheet Governance

System sheets:

- Dashboard
- Validation
- Timing
- Framework Tests
- Health Check

Templates are explicitly excluded from system-sheet governance and have separate visibility controls.

14. Change Control Governance

Every future release must:

- Review duplicate functions
- Review constants
- Review menus
- Replace affected functions completely
- Remove obsolete logic
- Preserve dashboard-first governance
- Preserve single-file architecture
- Avoid patch layering

These requirements are explicitly embedded in v1.5.11.

Recommendation

For Codex, I would create:

None
