

Dashboard Quality Specs

A — Global Inputs Verification

Purpose: confirm the dashboard has the required global settings needed to build templates.

Steps:

1. Load dashboard configuration.
2. Read required global input fields.
3. Check each required field is present.
4. Check each required field is not blank.
5. Check values are usable where required, such as row numbers, date format, font, or version.
6. Write only missing, blank, invalid, or unavailable settings.
7. If no issues exist, write one PASS summary row.

Headers:

SECTION A - Global Inputs Verification

Setting | Status | Issue | Quality Notes

Setting = The required dashboard global setting being validated. Examples include framework version, date format standards, report configuration values, template control settings, or other governed dashboard-level inputs. Data comes directly from the Dashboard Global Inputs configuration area.

Status = Result of the validation for the setting. Expected values include PASS, WARNING, FAIL, CRITICAL, NOT RUN, or NOT AVAILABLE. Generated by the validation logic.

Issue = Specific problem identified for the setting. Examples include Missing Value, Blank Value, Invalid Value, Duplicate Setting, or Configuration Conflict. Blank if no issue exists.

Quality Notes = Detailed explanation of the validation result, including expected value, actual value, corrective action, or additional context.

B — Sheet Definitions Verification

Purpose: confirm every governed sheet used by the framework is defined on the dashboard.

Steps:

1. Load dashboard sheet definition table.
2. Build required sheet list from governed framework sheet types.
3. Check each required sheet type exists in dashboard definitions.
4. Check required fields exist, such as sheet type, report title, template name, and base color.
5. Report missing or incomplete sheet definitions.
6. If no issues exist, write one PASS summary row.

Headers:

SECTION B - Sheet Definitions Verification

Sheet | Status | Issue | Quality Notes

Sheet = The governed sheet definition being validated. Examples include Dashboard Quality Report, Framework Timing Report, Monthly Change Report, Master List, Care Plan Due, or other dashboard-controlled sheet definitions. Data comes from the Dashboard Sheet Definitions table.

Status = Result of the validation for the sheet definition.

Issue = Specific problem identified with the sheet definition. Examples include Missing Definition, Invalid Sheet Type, Missing Template Association, Missing Configuration, or Duplicate Definition.

Quality Notes = Additional explanation regarding the sheet definition validation result.

C — Sheet Headers Verification

Purpose: confirm dashboard header definitions are usable as the source of truth.

Steps:

1. Load dashboard header definition table.
2. Group headers by sheet type.
3. Check each governed sheet has at least one header.
4. Check for blank header names.
5. Check for duplicate header names within each sheet type.
6. Check required key headers exist where needed, such as PMR, name, date, and status fields.
7. Report only missing, blank, duplicate, or invalid headers.
8. If no issues exist, write one PASS summary row.

Headers:

SECTION C - Sheet Headers Verification

Header | Status | Issue | Quality Notes

Header = The dashboard header definition being validated. Data comes from the Dashboard Header Definitions table.

Status = Result of validating the header definition.

Issue = Specific problem identified. Examples include Missing Header, Blank Header, Duplicate Header, Invalid Header Name, or Required Header Not Found.

Quality Notes = Additional details regarding the header validation.

D — Column Definitions Verification

Purpose: confirm every governed column has the required build properties.

Steps:

1. Load dashboard column definition table.
2. For each dashboard header, find its column definition.
3. Check required properties: width, alignment, wrap, number format, visibility.
4. Validate width is numeric and greater than zero.
5. Validate alignment and wrap values are usable.
6. Validate date columns have date format where required.
7. Report only missing, blank, or invalid definitions.
8. If no issues exist, write one PASS summary row.

Headers:

SECTION D - Column Definitions Verification

Column | Status | Issue | Quality Notes

Column = The dashboard column definition being validated. Data comes from the Dashboard Column Definitions table.

Status = Result of validating the column definition.

Issue = Specific problem identified. Examples include Missing Width, Missing Alignment, Missing Format, Missing Visibility Setting, Invalid Width, or Invalid Format.

Quality Notes = Additional details regarding the column configuration issue or validation result.

E — Sheet Behavior Verification

Purpose: confirm sheet-level behavior settings needed to build templates are present.

Steps:

1. Load dashboard behavior table.
2. Check each governed sheet has behavior settings.
3. Verify required behavior fields exist, such as title rows, filters, alternating colors, subheaders, hidden template, frozen rows, and frozen columns when governed.
4. Report only missing, blank, or invalid behavior fields.
5. If no issues exist, write one PASS summary row.

Headers:

SECTION E - Sheet Behavior Verification

Behavior | Status | Issue | Quality Notes

Behavior = The sheet behavior setting being validated. Examples include frozen rows, filters, title rows, alternating colors, hidden templates, protections, grouping, or governed formatting behaviors. Data comes from Dashboard Sheet Behavior configuration.

Status = Result of validating the behavior setting.

Issue = Specific problem identified. Examples include Missing Behavior, Invalid Setting, Missing Freeze Configuration, Missing Filter, or Missing Protection.

Quality Notes = Additional information regarding the behavior validation result.

F — Template Structure & Validation

Purpose: confirm templates were created correctly from dashboard inputs.

Steps:

1. Load dashboard configuration.
2. For each governed sheet definition, locate its template.
3. Verify the template exists.
4. Verify template title rows exist where required.
5. Verify template header row exists.
6. Compare template headers to dashboard header definitions.
7. Identify missing template headers.
8. Identify unexpected template headers.

9. Validate required template sections or subsections.
10. For Monthly Change, verify subsection title row, spacer row, subsection header row, and formatting block.
11. Report template structure problems.
12. If no issues exist, write one PASS summary row.

Headers:

G — Date Format Integrity Validation

Purpose: confirm Google Sheets preserved governed date formats.

Steps:

1. Load dashboard date-column definitions.
2. For each template, identify governed date columns.
3. Verify each date column exists on the template.
4. Read the actual number format from the template date column.
5. Confirm date format is present.
6. Sample template cells in the date column.
7. Confirm displayed values are not numeric serial numbers.
8. Confirm cells are not left as General format where a date format is required.
9. Report missing date columns, missing formats, general formats, serial-number display, or mismatches.
10. If no issues exist, write one PASS summary row.

Headers:

SECTION G - Date Format Integrity Validation

Column Header | Date Format Present | Status | Quality Notes

Column Header = The governed date column being validated. Examples include Date of Birth, Enrollment Date, Last Care Plan Date, Next Care Plan Due Date, Capitation Date, or other governed date fields. Data comes from Dashboard Header Definitions and Template Validation.

Date Format Present = The actual date format detected on the template column. Examples include mm/dd/yyyy, m/d/yyyy, General, Text, or Missing Format.

Status = Result of the date validation. Determines whether the column is displaying and storing dates correctly.

Quality Notes = Details of the validation including detected format, sample values tested, serial-number conversion findings, General-format findings, or corrective recommendations.

H — Dashboard Audit

Purpose: confirm the dashboard itself is structurally usable.

Steps:

1. Verify dashboard sheet exists.
2. Verify required dashboard sections or tables exist.
3. Verify expected dashboard anchors or headers exist.
4. Verify dashboard tables contain usable rows.
5. Verify dashboard configuration can be loaded without error.
6. Report missing sections, missing tables, unreadable ranges, or load errors.
7. If no issues exist, write one PASS summary row.

Headers:

SECTION F - Dashboard Audit

Area | Item | Status | Quality Notes

Area = The major dashboard audit category being reviewed. Examples include Dashboard Configuration, Dashboard Structure, Dashboard Integrity, Dashboard Accessibility, Dashboard Definitions, or Dashboard Controls.

Item = The specific audit item being validated within the Area. Examples include Global Inputs Loaded, Header Definitions Loaded, Required Anchors Present, Dashboard Sheet Found, or Configuration Readable.

Status = Result of the audit item validation.

Quality Notes = Detailed explanation of the audit result including findings, observations, warnings, or recommendations.

I — Framework Health Check

Purpose: provide framework-wide health status.

Steps:

1. Verify current script version is available.
2. Verify required menu callbacks exist.
3. Verify required system sheets exist.
4. Verify required templates exist or are marked not yet created.
5. Verify timing system exists.
6. Verify Dashboard Quality sections A–O exist.

7. Verify no critical required helper is missing.
8. Report missing framework components or critical warnings.
9. If no issues exist, write one PASS summary row.

Headers:

J — Signoff

Purpose: summarize readiness for release or operational use.

Steps:

1. Check whether Startup sections A–E have run.
2. Check whether Template Validation sections F–G have run.
3. Check whether Workflow sections H–O have run.
4. Check whether any section has FAIL or CRITICAL status.
5. Check whether timing contains unresolved bottlenecks.
6. Check whether required validation reports are present.
7. Write release-readiness status.
8. If not ready, write required next action.

Headers:

K — Summary

Purpose: roll up Dashboard Quality results.

Steps:

1. Read all Dashboard Quality section rows.
2. Count PASS rows.
3. Count WARNING rows.
4. Count FAIL rows.
5. Count CRITICAL rows.
6. Count NOT RUN rows.
7. Identify empty sections.
8. Identify the most recent update timestamp per section.
9. Write overall quality status.

Headers:

L — Performance Summary

Purpose: summarize runtime performance from Framework Timing.

Steps:

1. Load Framework Timing Report.
2. Read process summary.
3. Read detailed timing log.
4. Identify slow, bottleneck, and critical steps.
5. Calculate total runtime by process.
6. Identify worst severity by process.
7. Write open performance recommendations.
8. If timing report is missing, write NOT AVAILABLE.

Headers:

M — Master List Health Check

Purpose: confirm Master List readiness and integrity.

Steps:

1. Locate current Master List sheet.
2. Verify required Master List headers exist.
3. Verify Primary PMR Row column exists.
4. Verify required PMR/name/date/status fields exist.
5. Check for blank key fields where applicable.
6. Check for duplicate or missing PMR identifiers where applicable.
7. Confirm governed update tracking columns exist.
8. Report missing or invalid Master List conditions.
9. If full Master List processing is outside scope, write NOT RUN with explanation.

Headers:

N — Care Plan Sync Diagnostics

Purpose: confirm Care Plan synchronization readiness.

Steps:

1. Identify current Master List month.
2. Identify matching Care Plan Due sheet.
3. Identify matching Unlocked Care Plan sheet.
4. Verify required sync headers exist on each sheet.
5. Compare PMR or participant identifiers where available.
6. Identify missing Care Plan records.
7. Identify unmatched records.
8. Verify sync fields are available for writing or validation.

9. If Care Plan sheets are unavailable, write NOT AVAILABLE.
10. If full sync is outside scope, write NOT RUN with explanation.

Headers:

O — Workflow & Synchronization Verification

Purpose: confirm major workflow and synchronization logic is functioning or available.

Steps:

1. Verify workflow callback functions exist.
2. Verify required synchronization helper functions exist.
3. Check contact processing availability.
4. Check phone split logic availability.
5. Check address combine logic availability.
6. Check language handling availability.
7. Check notes summary logic availability.
8. Check banner summary logic availability.
9. Check Care Plan sync availability.
10. Check Primary PMR assignment availability.
11. Report available, missing, not run, or not in scope.
12. If no workflow execution occurred, write NOT RUN with explanation.

Headers:
