

Short Answer

No — Wave 4 is not clear yet based on the v1.6.64 Framework Timing Report.

The workflow is now functionally reaching completion, but the timing report still shows CRITICAL / BOTTLENECK items that should remain open for Wave 4 follow-up.

The most important issue you noticed is correct:

Create Monthly Update is still using Update Master List, and that is the wrong pathway if Master List is now created new each month.

In the current script, runMonthlyUpdate() still calls updateMasterListForMonth_(monthParts).

{line_range_start=11785 line_range_end=11790 path=Master_List/Current Production

Script/v.1.6.65_Current_Production_Script

git_url="https://github.com/tabs912/CodeLab/blob/main/Master_List/Current Production

Script/v.1.6.65_Current_Production_Script#L11785-L11790"}
That function copies the previous Master List forward, which matches the legacy update

behavior. {line_range_start=11883 line_range_end=11908 path=Master_List/Current Production

Script/v.1.6.65_Current_Production_Script

git_url="https://github.com/tabs912/CodeLab/blob/main/Master_List/Current Production

Script/v.1.6.65_Current_Production_Script#L11883-L11908"}
The newer standalone createMasterList() path creates a fresh current-month Master List from

Demo P instead. {line_range_start=11977 line_range_end=12018 path=Master_List/Current

Production Script/v.1.6.65_Current_Production_Script

git_url="https://github.com/tabs912/CodeLab/blob/main/Master_List/Current Production

Script/v.1.6.65_Current_Production_Script#L11977-L12018"}

Diff Cleanup Status

The implementation diff is already clean. It contains only the three requested files:

Master_List/Audit_Summary/OPTIMIZATION_CANDIDATES_v1.6.58.md

Master_List/Audit_Summary/WAVE_4_PERFORMANCE_INSTRUMENTATION_v1.6.42.md

Master_List/Current Production Script/v.1.6.65_Current_Production_Script

No other production script snapshots remain in the cleaned task diff.

v1.6.64 Timing Review

I reviewed Master_List/Reports/v1.6.64 - Framework Timing Report.pdf from origin/main after syncing remote references.

Process Summary Findings

The report shows:

Process	Runtime	Status	Meaning
Build Demo P Initialization	~49.5 sec	PASS	Functionally acceptable, with slow substeps.
Create Disenrolled List	~114.4 sec	CRITICAL	Still not clear in this report.
Create Master List	~55.8 sec	PASS	Functionally acceptable, but has one bottleneck.
Create Monthly Update 05.01.26	~308.7 sec	CRITICAL	Not clear.
Update Master List	~87.8 sec	SLOW	Legacy path still being used.

Key Performance Issues

The report identifies these important issues:

Area	Reported Issue	Status
Create Disenrolled List	Append payload write, 719 rows × 66 columns	CRITICAL
Create Master List	Locate current processed Demo P sheet	BOTTLENECK
Update Master List	Copy previous Master List to current month	BOTTLENECK
Create Monthly Update	Master List complete	CRITICAL
Create Monthly Update	Disenrolled List complete wrapper	BOTTLENECK
Create Monthly Update	Final Index / active tab organization	SLOW

Main Finding — Monthly Update Is Using the Legacy Master List Path

Current behavior

runMonthlyUpdate() calls:

```
const masterSheet = updateMasterListForMonth_(monthParts);
```

That is the legacy update path. {line_range_start=11789 line_range_end=11790

path=Master_List/Current Production Script/v.1.6.65_Current_Production_Script

git_url="https://github.com/tabs912/CodeLab/blob/main/Master_List/Current Production

Script/v.1.6.65_Current_Production_Script#L11789-L11790"}

Why this matters

updateMasterListForMonth_() requires the previous Master List and copies it forward:

```
const previousMaster = getPreviousMasterListSheet_(monthParts);
```

...

```
currentMaster = copyPreviousMasterListToCurrentMonth_(previousMaster, monthParts);
```

That means it is updating from the previous month rather than creating a fresh Master List from

current Demo P. {line_range_start=11892 line_range_end=11908 path=Master_List/Current

Production Script/v.1.6.65_Current_Production_Script

git_url="https://github.com/tabs912/CodeLab/blob/main/Master_List/Current Production

Script/v.1.6.65_Current_Production_Script#L11892-L11908"}

Correct direction

If Master List is no longer updated and should be created fresh each month, then Create

Monthly Update should stop calling updateMasterListForMonth_().

It should call a month-scoped create path equivalent to createMasterList(), using the selected monthParts from the Monthly Update prompt.

Recommended Code Change

Recommendation 1 — Replace legacy Update Master List in Monthly Update

Create a month-scoped helper such as:

```
function createMasterListForMonth_(monthParts, timing) {
```

```
  // same business path as createMasterList(),
```

```
  // but without prompting again
```

```
}
```

Then change runMonthlyUpdate() from:

```
const masterSheet = updateMasterListForMonth_(monthParts);
```

to:

```
const masterSheet = createMasterListForMonth_(monthParts, timing);
```

This would align the Monthly Update workflow with the new rule:

Master List is created new each month, not updated from the prior Master List.

Recommendation 2 — Keep Update Master List out of the Monthly Update chain

I would not delete `updateMasterListForMonth_()` yet unless you are sure no menu item, compatibility path, or historical workflow still uses it.

But I recommend treating it as legacy:

- Remove it from Create Monthly Update.
 - Rename menu labels if needed to avoid confusion.
 - Keep the function only as a compatibility/manual legacy path until formally retired.
-

Recommendation 3 — Retest Create Monthly Update after replacing the Master List step

After Monthly Update uses the fresh-create path, rerun:

Create Monthly Update

Expected improvement:

- No Update Master List process should appear as part of Monthly Update.
 - No Copy previous Master List to current month timing should appear.
 - Create Monthly Update - Master List complete should reflect the fresh create path instead.
 - Monthly Update runtime should drop materially if the copy-forward legacy step is removed.
-

Recommendation 4 — Recheck Disenrolled List with v1.6.65

The v1.6.64 report still shows Disenrolled append as CRITICAL.

However, the current v1.6.65 script includes a sparse write helper that writes only non-empty column groups for the Disenrolled append payload. {line_range_start=14192

line_range_end=14233 path=Master_List/Current Production

Script/v.1.6.65_Current_Production_Script

git_url="https://github.com/tabs912/CodeLab/blob/main/Master_List/Current Production

Script/v.1.6.65_Current_Production_Script#L14192-L14233"}
The Disenrolled append path now records column groups and cells written.

{line_range_start=14303 line_range_end=14307 path=Master_List/Current Production

Script/v.1.6.65_Current_Production_Script

git_url="https://github.com/tabs912/CodeLab/blob/main/Master_List/Current Production Script/v.1.6.65_Current_Production_Script#L14303-L14307"}
So I recommend retesting:

Create Disenrolled List

with v1.6.65 and checking whether the timing row changes from:

Rows: 719; Columns: 66

to something like:

Rows: 719; Columns: 66; Column groups: X; Cells written: Y

If that timing drops, then the Disenrolled append issue may be resolved or downgraded.

Recommendation 5 — Add timing around the Monthly Update wrapper gaps

The v1.6.64 timing showed internal Disenrolled steps completing, but the wrapper row:

Create Monthly Update - Disenrolled List complete

still had a large bottleneck.

That suggests some cost is happening after the measured internal steps but before the wrapper completion mark.

Recommended added timing:

- before old-row hiding
 - after old-row hiding
 - before returning from createDisenrolledListForMonth_()
 - after return to runMonthlyUpdate()
 - before/after any Index refresh, tab positioning, or visibility step
-

Is Wave 4 Clear?

No.

I would mark Wave 4 as:

Not clear — implementation improved, but final Monthly Update path still needs correction.

Wave 4 can be cleared when:

1. Create Monthly Update uses fresh Master List creation, not legacy Update Master List.
 2. Update Master List / Copy previous Master List to current month no longer appears in Monthly Update timing.
 3. Create Monthly Update completes without CRITICAL rows.
 4. Create Disenrolled List is retested on v1.6.65 and the sparse write behavior is confirmed.
 5. System/template sheets remain hidden after Monthly Update.
 6. Active sheets remain in the requested order behind Index.
-

Recommended Next Implementation

I recommend the next production script version should be:

v1.6.66

Scope:

1. Add createMasterListForMonth_(monthParts, timing).
2. Refactor createMasterList() to call that helper after prompting.
3. Update runMonthlyUpdate() to call createMasterListForMonth_() instead of updateMasterListForMonth_().
4. Keep updateMasterListForMonth_() as legacy/manual only for now.
5. Add timing rows that make it clear Monthly Update is using fresh Master List creation.
6. Retest Create Monthly Update.
