

Wave 7 Test Plan

Static / Repository Checks

- Duplicate top-level function scan.
- Undefined helper scan.
- Menu callback existence scan.
- Trigger handler existence scan.
- Manifest presence/validation check.
- No Archive_To_Move/ dependency check.
- Function inventory regeneration after remediation.

Unit-Like Tests

Because this is Apps Script, these are best implemented as test harness functions in a copied workbook or as local static/data harnesses where possible.

- deleteRowNumberBatches_() replacement logic:
 - empty row list
 - single row
 - contiguous rows
 - non-contiguous rows
 - duplicate row numbers
 - rows below DATA_START_ROW
- Retained-row rewrite helper:
 - preserves header rows
 - preserves retained active rows
 - removes exact PMR set

- handles blank rows
- handles duplicate PMR/contact rows
- Raw Data source validation:
 - valid Raw Data import
 - template sheet rejected
 - output Raw Data sheet rejected
 - Dashboard/Index/system sheet rejected
 - similarly shaped wrong sheet rejected or explicitly accepted only by policy

Spreadsheet Integration Tests

- Run System Setup in a copied workbook.
- Run Framework Smoke Validation separately.
- Rebuild templates.
- Validate templates.
- Build Index and verify all expected current/monthly/template/report sections.
- Format Raw Data and verify:
 - headers
 - dates
 - output sheet name
 - formulas/values
 - visibility policy
 - source delete/archive/retain policy
- Build Demo P from scratch from valid Raw Data.
- Attempt Demo P build from wrong active sheet.

Regression Tests

- Compare output row counts and PMR sets before/after Wave 1.
- Compare Disenrolled Exclusion rows before/after large disenrollment.
- Compare Monthly Sync changed PMR replacement before/after sequencing change.
- Verify unchanged menu entry points.
- Verify unchanged public workflow names.
- Verify no approved business logic changed.

Destructive-Operation Tests

- Create Disenrolled List:
 - 0 disenrolled rows
 - 1 disenrolled row
 - 8 disenrolled rows
 - 719 disenrolled rows
 - 1,000 disenrolled rows
- Confirm:
 - Raw Data remains unchanged.
 - Demo P active PMR set is correct.
 - Disenrolled Exclusion receives expected primary rows.
 - Re-enrolled PMRs are removed from exclusion only when intended.
- Monthly Sync:
 - Raw Data missing
 - Raw Data wrong headers
 - zero changed PMRs
 - small changed PMR set

- large changed PMR set
- interruption after validation but before write
- interruption during write, if testable

Trigger Tests

- Install index refresh trigger once.
- Confirm duplicate trigger prevention.
- Create/remove sheets during:
 - monthly formatting
 - template rebuild
 - disenrollment workflow
- Confirm busy flag skip/defer behavior.
- Confirm Index rebuilds once after workflow if deferred.
- Two-user duplicate execution simulation.

Library / Host Compatibility Tests

If Master_List is consumed externally or as a library:

- Identify documented public functions.
- Search external host scripts for function calls.
- Verify no public function is renamed or removed.
- Verify compatibility wrappers remain.
- Validate menu functions:
 - onOpen
 - setup/admin callbacks
 - format/process callbacks

- diagnostics callbacks

Performance Tests

- Capture baseline and after-remediation timings for:
 - Create Disenrolled List
 - Update Demo P Monthly Sync
 - Format Monthly Sheets
 - Format Raw Data
 - Build Monthly Change Report
- Test datasets:
 - 1k rows
 - 5k rows
 - 10k rows
 - large disenrollment set
 - large monthly-change PMR set
- Record:
 - total runtime
 - row deletion/rewrite time
 - formatting time
 - row-height time
 - filter time
 - report-writing time

Report-Validation Tests

- Confirm Framework Timing Report still writes.

- Confirm Dashboard Quality Report still writes.
- Add and verify CSV/JSON report companions if approved.
- Confirm report exports are stable enough for diffing across runs.
